

environmental weeds

Weedy plants
threatening the health
of the local environment

AFRICAN DAISY

African daisy (*Osteospermum ecklonis*) is a very popular garden plant that has emerged as one of the most serious environmental weeds along the Far South Coast.

African daisy is a tough, drought-tolerant plant and does best in poor, dry, well-drained soil in full sun. It will actually not perform well if the soil is rich and well watered!

It is a robust herb or shrub reaching up to a metre in height. It has coarsely toothed leaves and flowers that are white or pink above and blue to violet below.

Most have a dark blue centre to their flowers. The simple daisy-like flowers open when the sun is shining with the main flowering period from late winter to late spring.

Seeds are long-lived and are wind and water dispersed. They are commonly spread by dumping.

African daisy invades a wide range of habitats, particularly beaches, dunes and dry forest. It is very widespread around all coastal communities and is rapidly invading adjacent bushland where it can form a dense understorey excluding native species.

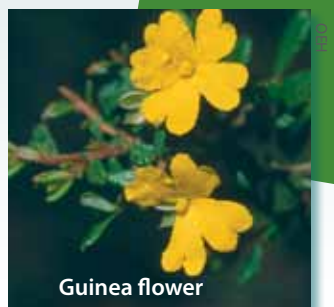

African daisy

Grow these instead*

Choose a native plant that has similar spectacular flowers but is less invasive.

Fan flowers (*Scaevola* species and cultivars), prostrate guinea flower (*Hibbertia diffusa* and other *Hibbertia* species) and paper daisy cultivars (*Xerochrysum bracteatum* – formerly *Helichrysum* or *Bracteantha bracteata*).

Some native plants that
grow well on the south
coast include:

Smothering morning glory vines

Weedy garden plants cause many problems IN your garden and also OUTSIDE your garden. When they invade surrounding bushland they may

- ✗ smother plants
- ✗ destroy habitat
- ✗ create fire hazards and
- ✗ block access ways

They often have high seed production and long seed dormancy.

✓ be a responsible gardener

Help reduce the spread of weedy garden plants

Choose garden plants that will not threaten the health of the natural environment, but rather enhance the environment by being

- ✓ non-invasive
- ✓ local native plants
- ✓ wildlife habitat and food
- ✓ effective soil stabilisers
- ✓ attractive to birds

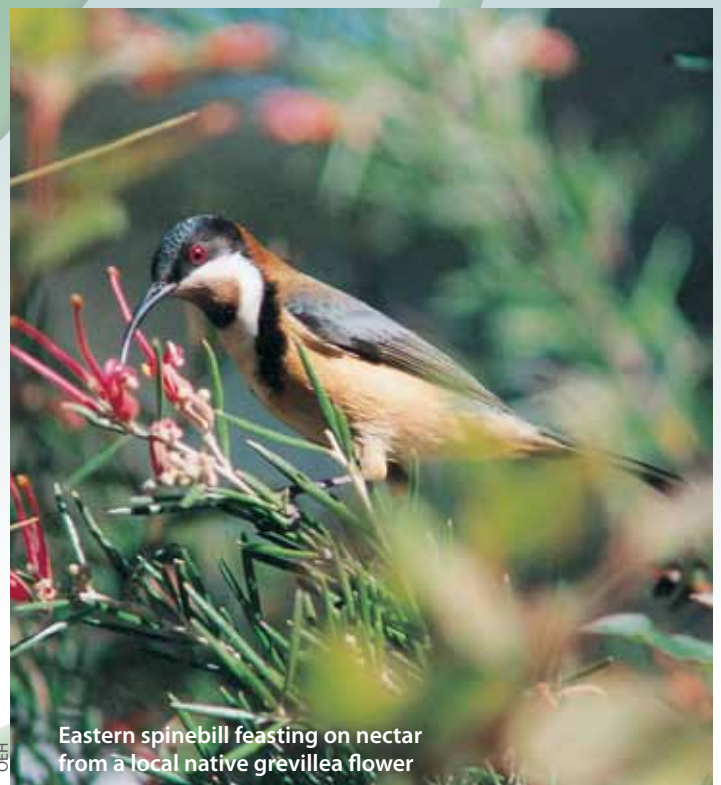

Never dump garden refuse into the bush or over the garden fence, not even lawn clippings.

Instead **compost garden waste**, mulch garden off-cuts, make use of green waste bins or deliver garden refuse to the local tip.

Control, remove and replace plants that are escaping your garden.

Avoid choosing those plants that are likely to invade adjacent bushland before the problem becomes a major weed invasion.
